
Magnitude (one-shot)
per $V \times M$ block: keep 4 columns with largest $\sum |w|$
per row: keep 2 largest $|w|$ of the 4
30-ep masked fine-tune + KD
One-shot OBS (SparseGPT-style)
calibrate: $H = \frac{2}{N} \sum xx^\top$ from im2col of 1024 images; Cholesky of H^{-1}
per M-column group: saliency $w^2/[H^{-1}]^2_{cc}$ $\rightarrow$ choose 4 columns, then 2 per row
prune + push error onto later columns $\delta w = -\frac{w_c}{[H^{-1}]_{cc}} H^{-1}_{:,c}$
next layer (Hessian through pruned layers) then 30-ep masked fine-tune + KD
Gradual OBS (VENOM / oBERT-style)
dense model
OBS: keep 16 of 32 columns / block + 5 ep fine-tune
OBS: keep 8 columns + 5 ep
OBS: keep 4 columns + 5 ep
OBS: 2:4 inside kept columns + 30 ep fine-tune (= 2:32)
fresh Hessian at every step; masks nested (no regrowth)
2:8 = 2 steps (35 ep), 2:16 = 3 (40 ep), 2:32 = 4 (45 ep)
